Referativnyy zhurnal. Avtomatika i radioelektronika, no. 8, 1962, abstract 8-7-116 e (Czech. pat., cl. 21a⁴, 46/03, no. 98474, Feb. 15, 196:)

TEXT: The patent covers a complex directive TV aerial of the Yagi type, made out of wire elements which are stretched over a vertical excited dipole and a transverse yardarm. The design economizes in costly tubing while giving the same characteristics as an aerial made out of tubing. The radiation pattern of such an aerial consists of two lobes in opposite directions together with two-side-lobes which are perpendicular to the others. Several versions of the aerial are considered, having the excited dipole made of tubing, of RF cable, and of corded wire. Two versions of the aerial were built for the 49.75 - 56.25 Mc/s TV channel using dipoles made out of 270 and 240 cm of tubing, with SWR over the whole frequency band > 2.5 [Abstracter's note: Presumably a misprint should be < 2.5] and with Card 1/2

KRUPKIN, A.I.

Colorimetric analysis of materials with high content of components to be analyzed. Trudy kom. anal. khim. 8:204-209 *58. (MIRA 11:8)

1.Gosudarstvennyy opticheskiy institut im. S.I. Vavilova. (Colorimetry)

AUTHORS: Krupkin, A. I., Zhechkova, L. A. 75-13-3-23/27 TITLE: On the Problem of the Photometric Determination of Zinc (K voprosu o fotometricheskom opredelenii tsinka) PERIODICAL: Zhurnal analiticheskoy khimii, 1958, Vol 13, Nr 3, PP - 370-571 (USSR) ABSTRACT: With modern photoelectric devices the light absorption can be measured with such a high accuracy that large amounts of an element can also be photometrically determined. The authors of the present communication worked out an indirect method of determination for zinc. It is based on the separation of zinc as a complex salt of pyramidone: (C₁₃H₁₇OM₃)₂.H₂[Zn(SCN)₄] (References 1-4). This compound is dissolved and pyramidone quantitatively determined by means of phosphorus-tungsten-molybdic acid. Phosphorus--tungsten-molybdic acid is by pyramidone reduced to molybdenum blue the color intensity of which is photometrically determined. The precipitation of zinc is done by mixing the solution to be investigated with pyramidone and po-Card 1/3 tassium thiocyanate in the presence of acetic acid (Refe-

75-13-3-23/27

rences 1-4). The precipitate is raily soluble, amylacetate being best suitable as washing liquid. The total volume of the solution in the precipitation, the duration of the precipitation and the temperature are of great importance for the quantitative separation of rinc. The precipitation is performed in a thermostat at 30 ± 10 in the course of 2 - 3 hours. A 12-fold excess of sodium, potassium, magnesium, calcium. aluminium and artimony ions (individually or in sum) do not disturb the determination of 0,1 mg ZnO; at concentrations up to 0,5 mg ZnO the above--mentioned cations at a 2-fold excess are not disturbing. Larger amounts of foreign ions were not investigated. Barium, lead and trivalent iron disturb the determination of zinc; barium and lead can, however, be separated in the form of sulfates. For determining pyramidone in the precipitate it is dissolved in boiling water and a solution of phosphorus-tungsten-molybdic acid is added at a constant temperature of 20°C. After having let it stand 1.5 - 3 hours at 20°C the optical density of the solution is measured by a red filter. The obtained results always

Card 2/3

On the Problem of the Photometric Determination of Zinc 75-13-3-23/27

are somewhat too low. But this fact does not disturb the determination of zinc with an accuracy of $\pm 0,1-0,3$ percentage by weight. At a zinc content higher than 0,5 mg in the solution to be analyzed the method can not be employed. This method was employed for the determination of zinc in glasses. On this occasion satisfactory results were obtained. The duration of the determination without preparing the material amounts to 4 hours. The preparation of the solutions necessary for the determination and the performance itself are very exactly described. The method permits the determination of zinc up to amounts of 15% (as ZnO).

5(2) AUTHORS: Krupkin, A.I., Konovalov, V.L. 507/32-24-12-10/45 TITLE: Concerning the Maintenance of the Temperature Conditions in the Colorimetric Determination of Potassium in the Form of K2Pb[Ni(NC2/6] (O soblyudenii temperaturnykh usloviy pri kolorimetricheskom opredelenii kaliya v vide K₂Pb[Ni(NO₂)₆]) PERIODICAL: Zavodskaya Laboratoriya, 1958, Vol 24, Nr 12, pp 1444-1444 (USSR) ABSTRACT: It was suggested (Ref 1) that potassium be separated in the form of K2Pb[Ni(NO2)6]. The nickel in this compound could then be determined colorimetrically (Ref 2), and from the nickel content the potassium content could be calculated. In repeated applications of this method it was noticed that a variation in temperature can introduce larger errors into the analytical results. An investigation by the authors with regard to this observation showed that the influence of the temperature is greatest during the precipitation (calibration curves over a temperature range made on the FEK-M apparatus, Fig 1). The in

L 25718-66 EWT(m)/EWP(+) WH ACC NR AP6002801 SOURCE CODE: UR/0237/60/000/002/0024/0025 (n) AUTHOR: Krupkin, /. I.; Zhechkova, L. A. ORG: Accelerates photometric method for determination of silica in optical glass TITLE: SOURCE: Optiko-mekhanicheskaya promyshlennost', no. 2, 1960, 24-25 TOPIC TAGS: optic glass, silica, photometric analysis, chemical detection, sodium hydroxide ABSTRACT: In order to determine the amount of silica in optical glass, the authors used a solution of silicic acid in the capacity of a titrated solution, 1 ml of which contains 0.5 mg of silkon dioxide. This solution was obtained by combining 0.05 g of ground pure quartz and 0.7 g of pulverized sodium hydroxide. Water was added to this mixture, to make up a quantity of 100 ml. The presence of sodium hydroxide in the solution has made it possible to analyze cataloged brands of glass according to GOST 3514-57. Analytic measurements were made by means of a FEK-M photoclectric colorimeter. The experiments have proved that an excess of potassium and sodium does not interfere with the determination of silica. Magnetium, calcium, zinc, aluminum, and barium show no effect at a 1:1 ratio. In conclusion, the authors recommend the method of photometric determination of silica in optical glasses. TITLE:

On the Experience of the Work of Military Physicians in a Garrison

PERIODICAL:

Voyenno-meditainakiy zhurnal, 1958, Nr 2, pp 81-82 (USSR)

ABSTRACT:

The article describes a program designed to raise the qualifications of military physicians at the author's garrison hospital, and briefly outlines the 1-month course of theoretical and practical work performed by doctors attached to the hospital from other units. The results of the course are noted with satisfaction, especially in regard to the organization of medical treatment in the garrison as a result of the course.

Krupkina, F. A., Brodskiy, G. S., Afenas'yeva, ". V. Alkaline Ligmin as Initial Substance for the Production of Plantics (Shchelochnoy lignin kak syr'ye diya proisvodstva plantichenkikh mass)

PERIODICAL:

Hauchnyye doklady vysshey shkoly, Khimiya i khimicheskaya tekhnologiya, 1950, Nr 3, pp. 556 - 558 (USSR)

ABSTRACT:

Alkaline lignin represents a valuable starting material for the production of plastics, since it contains reactive groups. The authors prepared samples and determined the technical data as well as the physical and chemical properties of products of alkaline lignin. The optimum method for the production of phenol-li nin formaldehyde regin was determined. Based on investigations on the physico-chemical and electric properties of the pressed samples the following optima mixture was worked out: phenol 100 parts, lignin 100 parts, formaldehyde 17 parts, sulfuric acid 2 parts. By using this formula in the production of phenol lignin formaldehyde resins about 50% phenol and 40% formaldehyde can be saved. The stability of alkaline lignin in storing for 2 years was investigated and the results obtained

TITLE:

The Most Efficient Method of Plugging Drill Holes (Naiboleye effektivnyy metod likvidatsicanogo tamponasha skvashin)

PERIODICAL:

Razvedka i okhrana nedr, 1957, # 10, p 31-34 (USSR)

ABSTRACT:

At present, sealing of drill holes is effected by: 1. Filling up with a cement-olay mixture.

2. Filling up with clay balls.

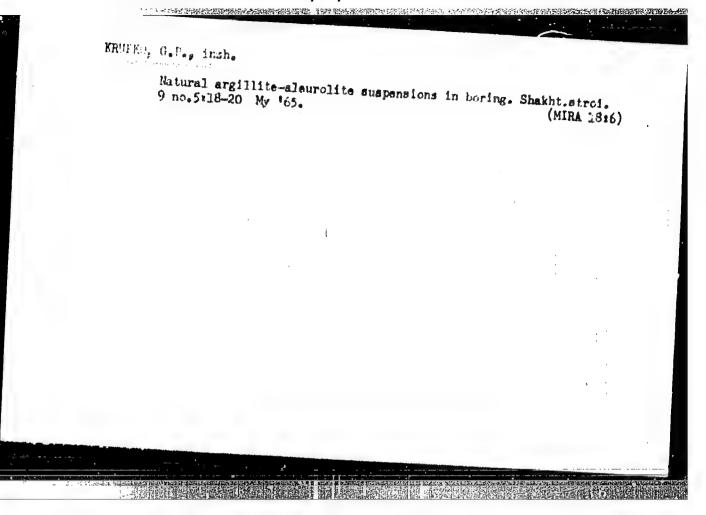

3. Hydraulic method.

4. Sealing with wooden plugs and ragbolts. None of these methods provide complete isolation from water bearing strata. A less expensive and approved method is the application of cement-clay or cement-sand-clay mixtures, which have good sealing properties and stand up to pressures up to 150-200 kg/sq cm. Admixtures of CaCl2 and Ca(OH)2 are added to improve and speed up the hardening process. This method of sealing drill holes is being widely applied in the Donets Basin and recommended by geologic organizations.

CIA-RDP86-00513R000826810002-4" APPROVED FOR RELEASE: 06/14/2000

"Treatment of Bone Fractures During Radiation Sickness Under Experimental Conditions," by I. L. Krupko, Chair of Orthopedics and Traumatology (head, Prof I. L. Krupko), Military-Medical Order of Lenin Academy imeni S. M. Kirov, Vestnik Khirurgii imeni I. I. Grekova, Vol 78, No 6, Jun 57, pp 106-109

The course of radiation sickness was studied in 366 rabbits subjected to 600 and 800 r total radiation. A group of these experimental animals were subjected to trauma (experimental fracture of femur) in addition to irradiation.

Results proved that (1) fractures aggravated the course of radiation sickness, especially if the fractures were infected; (2) best results were obtained after radical surgical treatment and metallic osteosynthesis, performed not six or nine hours, but 24 hours after the infliction of trauma and infection of fractures; (3) in all cases, if surgical treatment and metallic osteosynthesis were performed during the latent period of radiation sickness, the animals lived regardless of the use of antibiotics; and (4) antibiotics (penicillin and streptomycin) are indispensable in combating both endogenous and exogenous infections. Penicillin alone is ineffective, and only slightly prolongs the life of the animals. (U)
